

Historical CuTe hillclimb results

59 matched shapes: 0.086x → 1.045x against the best compared baseline

12.18x improvement in relative score · pre-cleanup combined-source refresh stopped after 2/60 cases

Three shapes per variant; * softmax backward uses two matched shapes because the third original run failed correctness.

Baselines include Triton and successful external providers, selected separately for each shape and measurement batch.

Before/current providers, source revisions and GPUs vary. The improvement above is not a matched aggregate runtime speedup.
